How can I get a full list of everything ALMA has observed?

Mark Lacy - 2020-09-21 - Resources & Observer Support

The command below will return a list of all science observations currently in the archive:

```
wget -O alma_aq_data.csv --no-check-certificate  
"http://almascience.org/aq/?result_view=raw&science_observations=&dow  
nload=true&format=CSV"
```

(the --no-check-certificate flag is only necessary for older OS)

This uses the programmatic interface to the ALMA archive. In principle, the same result can be obtained by not setting any selection criteria on the archive query interface and unchecking the "public data only" box, then using the "Export Table" link on the results page. However, there, only the first 10000 results will be shown.

Once you obtain the data.csv table you may load it into a spreadsheet programme, or [TOPCAT](#) for further analysis. The accompanying image, generated in TOPCAT shows the RA and Dec of all ALMA observations as of March 2015.
