Which frequency setup is possible for solar observations?

Misato Fukagawa - 2020-09-21 - Project Planning

The LO1 frequency for solar observations is fixed to 100 GHz for Band 3, 198 GHz for Band5, 239 GHz for Band 6 and 346.6 GHz for Band 7. Only proposals for continuum observations will be accepted. For the interferometric observations, these will be obtained using the low spectral resolution (TDM) mode, and the high spectral resolution (FDM) mode is not offered (please see Appendix Section "Solar Observations" in [Proposer's Guide](#)).
